He hypothesized that maybe at one time all of the continents were joined together in one landmass that Wegener called, Pangaea and that the continents have been slowly drifting apart in a process called Continental Drift.

Continental Drift | Earth Science

Continental drift was a theory that explained how continents shift position on Earth's surface. Set forth in 1912 by Alfred Wegener, a geophysicist and meteorologist, continental drift also explained why look-alike animal and plant fossils, and similar rock formations, are found on different continents. Wegener thought all the continents were once joined together in an "Urkontinent" before breaking up and drifting to their current positions.
